

Presentation

Slide 1: Executive Summary

****Clinical Assessment System Evaluation****

- Evaluation of synthetic data package for clinical decision support system
- Three claims evaluated against rigorous causal inference standards
- All three claims currently unsupported

Slide 2: The Three Claims

Slide 3: Critical Data Limitations

****Cannot identify:****

1. Which services actually switched on
2. Day-of-surgery vs. general cancellations
3. Full recommendation population from labeled sample

****Concurrent co-intervention:****

- Scheduling policy changed at same time as system

Slide 4: Claim 1 - Cancellations

****Unsupported by Observational Design****

- Missing: Independent service activation record
- Endpoint: Cannot map `cancel\_rate` to day-of-surgery
- Co-intervention: Scheduling policy change
- Sensitivity: +0.004 to -0.005 (inconsistent)

Slide 5: Claim 2 - Readiness

****Unsupported by Observational Design****

- Same treatment identification problem
- Competing risk from cancellations
- Administrative censoring at study end
- Sensitivity: +4.6 to +3.0 days (worse, not better)

Slide 6: Claim 3 - Agreement

****Unsupported With These Data****

- Labeled sample not random (500 of unknown total)
- No adjudicated ground truth
- LLM judge shares model family (conflict of interest)
- Observed: 77.1% agreement (not 89%)

Slide 7: Analyst Reproduction

****Key Defects Found:****

- Raw-key join loss
- Duplicate snapshot multiplication
- Selection on assessment generated
- Site B mixing
- No service-level inference

****Result:**** None of the four deck numbers reproducible

Slide 8: What the Data Cannot Prove

1. Selected treated services
2. System vs. policy change effect
3. Day-of-surgery endpoint
4. Full population from labels
5. Clinician correctness

Slide 9: Governance Recommendation

****Do NOT present the analyst deck to customers:****

Establish governance before any external communication:

- Evidence-based claims only
- Independent review required
- Document all decisions

Slide 10: Services Built

****Two containerized services:****

1. **Evaluation & Monitoring API**

- Score ingestion
- Drift/calibration/outcome monitoring
- Alert budget enforcement
- Full provenance tracking

2. **Analytics Assistant**

- Natural language to SQL
- Below-model authorization
- Zero authorization violations (tested)
- Test provider active

Slide 11: Path Forward

Immediate:

- Do not publish analyst deck
- Commission proper analysis

Medium-term:

- Obtain independent service records
- Implement proper study design

Long-term:

- Consider randomized implementation
- Build adjudicated ground truth

Slide 12: Summary

Recommendation: Transparent communication of limitations before any customer-facing materials.
